DIGITAL SILVER

014 / 13 OCT 2011 / LITECOIN / UNCOMMON

SILVER TO BITCOIN'S GOLD.

Charlie Lee bends toward a silver-lit computer in an open engineering lab. A second machine glows gold behind him. The two rigs and the arcs of blocks are a visual metaphor for two independently operating networks, not a documented photograph of his workspace or the precise hardware used at launch.

Lee introduced Litecoin to the Bitcoin forum on 9 October 2011, shared the source and binaries ahead of release, and invited people to test the software. In a follow-up to that same thread, he recorded the public launch as Thursday, 13 October, at 03:00 GMT. That launch - rather than the earlier announcement - is the date on this card.

Litecoin drew directly from Bitcoin's code, but chose Scrypt for its proof-of-work mining instead of Bitcoin's SHA-256. The original announcement set a target of roughly two and a half minutes per block, against Bitcoin's ten, and projected a maximum of about 84 million litecoins. Faster blocks did not make every payment instantly final; Lee explicitly noted the security trade-off in waiting for confirmations.

The aim was not to erase Bitcoin. Lee's announcement described a coin that could be silver to Bitcoin's gold: familiar in its foundations, different in its mining and rhythm. In the picture, the gold machine is still running as the silver one comes to life. One paper on the workbench reaches back to the earlier Whitepaper card, while a new chain begins to find its own place.

DETAILS IN THE ART

01 SCRYPT

The nameplate marks Litecoin's different proof-of-work algorithm; the gold Bitcoin machine represents a separate SHA-256 network.

02 2:30

The display is the target average interval between Litecoin blocks, not a stopwatch guaranteeing the next block in exactly two and a half minutes.

03 84,000,000

The pinned note points to Litecoin's planned approximate maximum supply, four times Bitcoin's 21 million.

04 TWO MACHINES

Silver and gold light coexist. Lee's launch post presented Litecoin as complementary and said Scrypt let people mine Litecoin while also mining Bitcoin; the image does not depict merged mining between those chains.

05 THE WHITEPAPER PAGE

The cream sheet recalls the hero page in card 005. Its 31 OCT 2008 stamp belongs to Bitcoin's paper, not Litecoin's launch. The QR partly conceals it on the card; the book artwork shows it in full.

SOURCE & ART NOTE

Lee's original [Litecoin announcement and launch follow-up](#) support the 9 October preview, 13 October public launch, silver/gold language, Scrypt, block target and supply. The [Litecoin Foundation's proof-of-work reference](#) explains the mining algorithm. The engineering lab, paired machines, Charlie's gesture and flying blocks are symbolic, not documentary details. The Whitepaper sheet is an intentional cross-card callback to [005 The Whitepaper](#), not a claim that this physical paper was on Lee's desk.
